##### SIMULATION STUDY FOR THE IV PAPER VAN DEN BERG, BONEV, MAMMEN
##### WHAT IS THE IMPACT OF CENSORING?
```

```
# ASSUMPTION: COMPLIANCE AND DURATION ARE DEPENDEND!
```

```
# Load necessary packages:
library(splines)
library(survival)
```

```
# TYPE DEPENDENCE: noncompliers stochastically dominate compliers without treatment
```

```
# The following specifications are done (durations are only nonnegative):
# 1) Compliers without the treatment have duration distributions N(60, sd=15)
# 2) The treatment is obtained on day 20. The distribution function is shifted to N(30, sd=10).
# 3) The noncompliers have N(45, sd= 10)
# 4) The following possibilities are exploited:
# i) censoring is jointly independent from (Compliance, Duration)
# ii) censoring and compliance are dependend
# iii) censoring and duration are dependend (higher risk are more likely to be censored)
# iv) censoring is dependend both from compliance and duration
```

```
# Cohort 1
```

```
n= 10000 # sample size
U.1=runif(n) # simulate individual duration probabilities under the uniform distr.
compl.prob=0.8 # the theoretical probability to be a complier at age 20
complier.1=sample(size=n,c(0,1),prob=c(1-compl.prob,compl.prob), replace=TRUE) #
compliance indicator
T.1=vector() # vector for the duration realizations
```

```
for(i in 1:n) {if (complier.1[i]==0) T.1[i]=qnorm(U.1[i], mean=45, sd=15) else if (U.1[i]<
pnorm(20,mean=60, sd=15)) T.1[i] =qnorm(U.1[i], mean=60, sd=15) else T.1[i] =qnorm(U.1[i],
mean=30, sd=10) } # Noncompliers obtain N(45, sd=15). Compliers obtain N(30, sd=10)
before day 50 and N(60, sd=15) after.
```

```
# Cohort 2
```

```
U.2=runif(n) # simulate individual duration probabilities under the uniform distr.
